

Presenting energiebüro® ag  
The Swiss number 1 for solar  
power plants

energiebüro® ag has been an internationally recognised competence centre for solar power plants since 1996. With over 10 professional employees and a market share of over 30 percent we are the Swiss market leader in photovoltaic – and active also in Germany and Spain

energiebüro® is the only Swiss engineering firm that specialises exclusively in grid-connected, building integrated solar power plants with its many facets. As a comprehensive service provider we have realised numerous large, award winning solar power plants in Switzerland, among them the world largest stadium-integrated solar power plant, Stade de Suisse in Bern, which was awarded the European Solar Prize.

### Independent and know-how driven

Although part of an international network of solar specialists, the Zurich based firm is completely independent: Management holds the majority of stocks and any service or labour is performed by energiebüro's own professional staff. Together with know-how and method competence this is highly appreciated by our customers.

### Well-known customers

Our customer base comprises utility companies and contractors, which invest in renewable energy, as well as large international industrial companies and service providers such as ABB, Alstom, the city council of Zurich or Bernische Kraftwerke AG BKW. References are enclosed.

### Highest quality standards

The company owners Christian Meier and Roland Frei as well as their team of engineers and consultants always aim for the very best solution for their customer – their demands strive toward the maximum: aesthetic solar power plants as a result of architectonically convincing solutions; only the best materials due to uncompromising quality standards; secure installation due to professional staff and cooperation with professional structural engineers; precise operation due to 24-hour monitoring.
